Testing & Evaluation Methods for ICT-based Safety Systems

Motivation and Objectives

Motivation

- Absence of an objective testing programme for active safety systems
- Weak customer awareness and understanding for those systems
- No common testing procedures → ineffective for all stakeholders

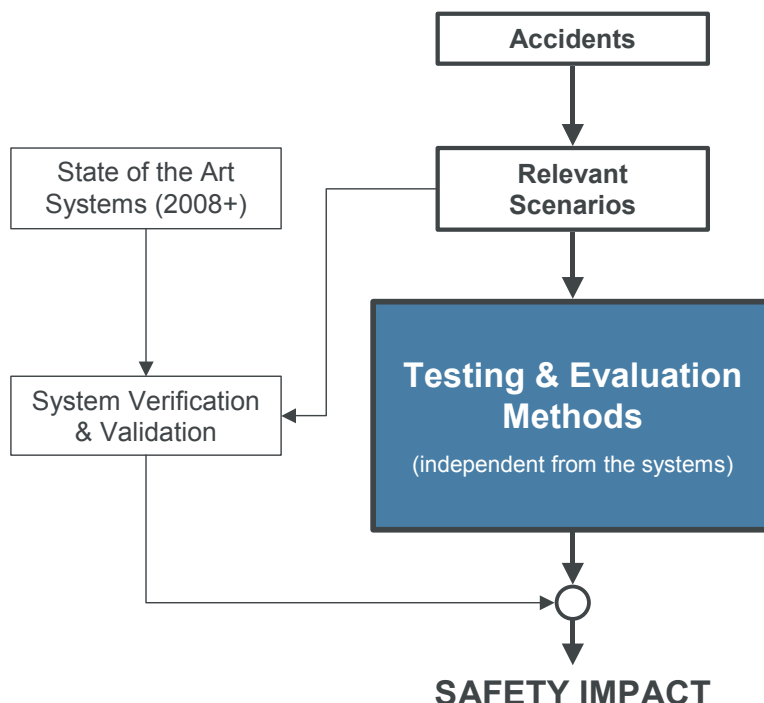

Objectives

- Objective testing procedures and evaluation methods for ICT-based (active) safety systems, ready for implementation by every interested organisation
- No fail or pass criteria (thresholds)
- Increased public perception and customer acceptance of active safety systems
- Support for the development of such systems at vehicle OEMs and suppliers

Project Plan

- Classification of state of the art systems (early-2008)
- Derivation of relevant scenarios (mid-2008)
- Definition of test specifications (late-2008)
- Definition of test strategies (mid-2009)
- Integration into test programme (mid-2010)
- Application of programme (2010)
